EXERCISE 10.1

Create a Launch Template

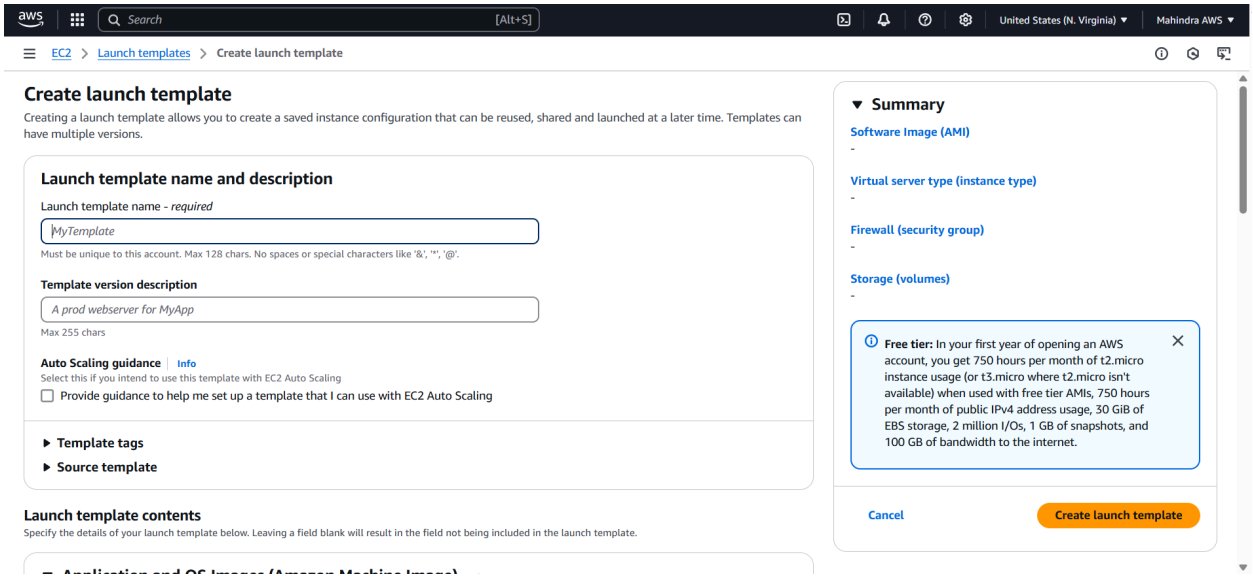

In this exercise, you'll create a launch template that installs and configures a simple web server.

You'll then use the launch template to manually create an instance.

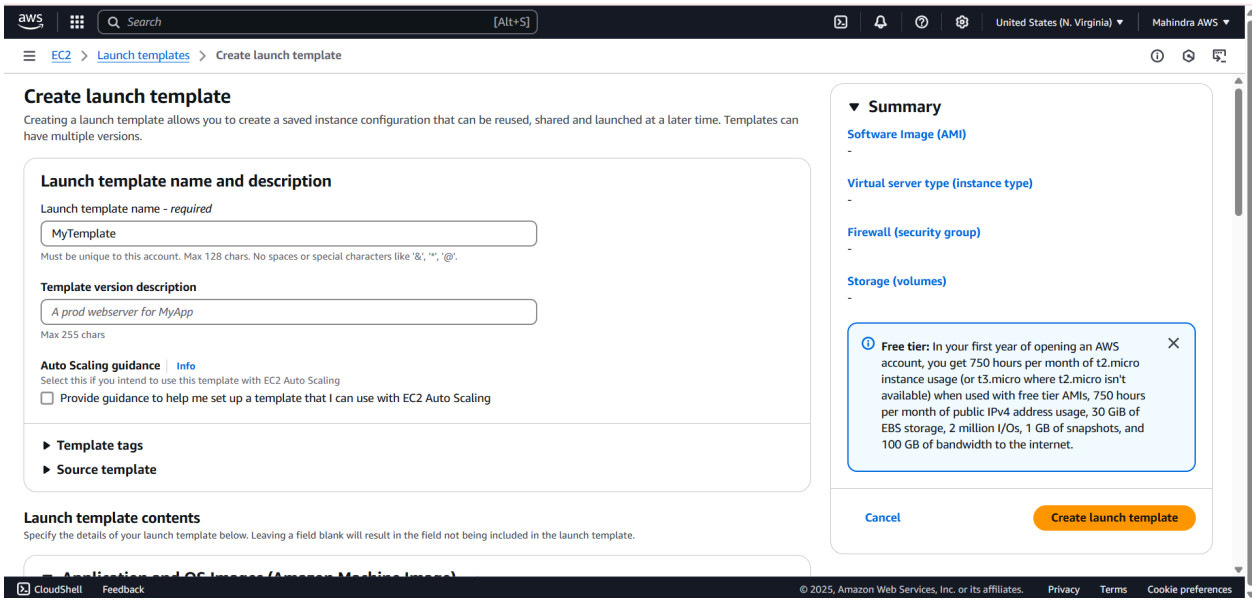

1. In the EC2 service console, click Launch Templates.

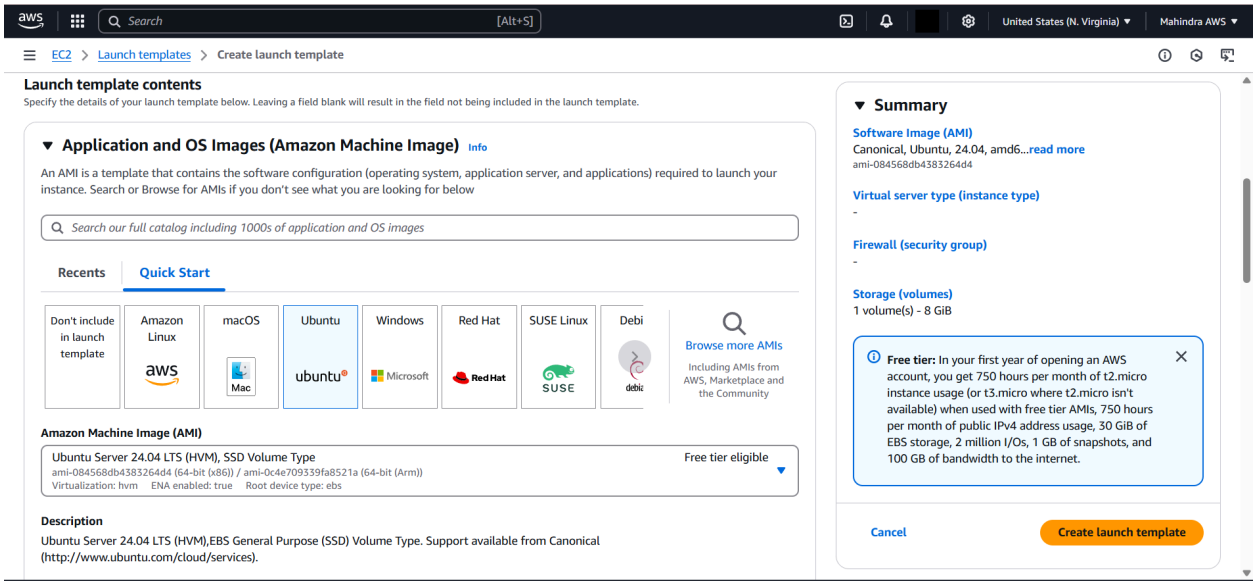

2. Click the Create Launch Template button.

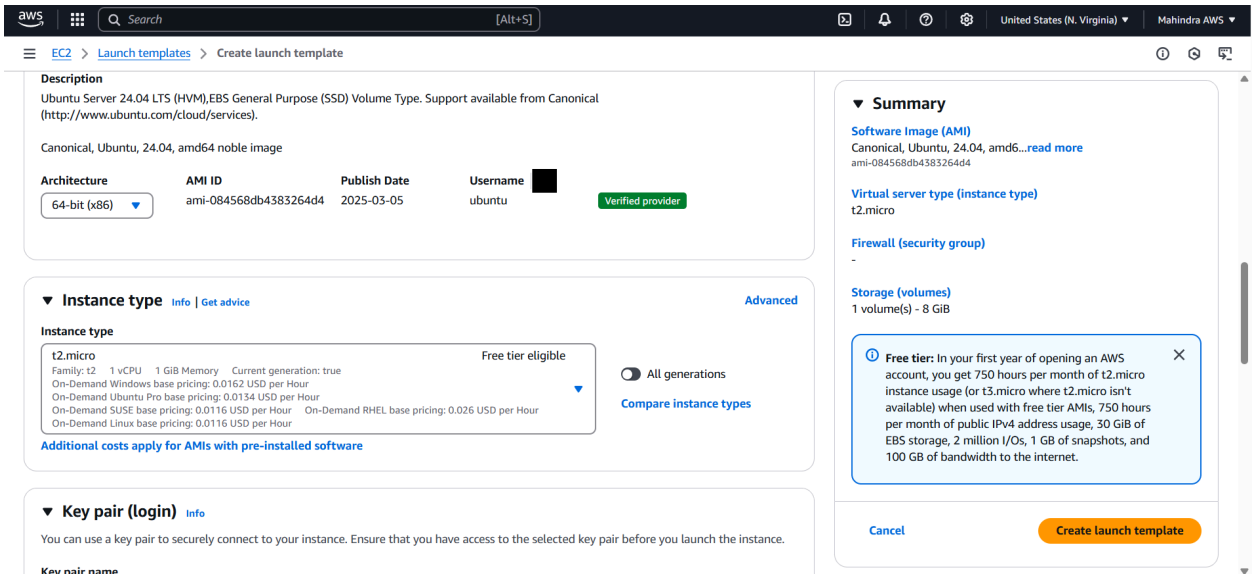

3. Give the launch template a name such as **MyTemplate**.

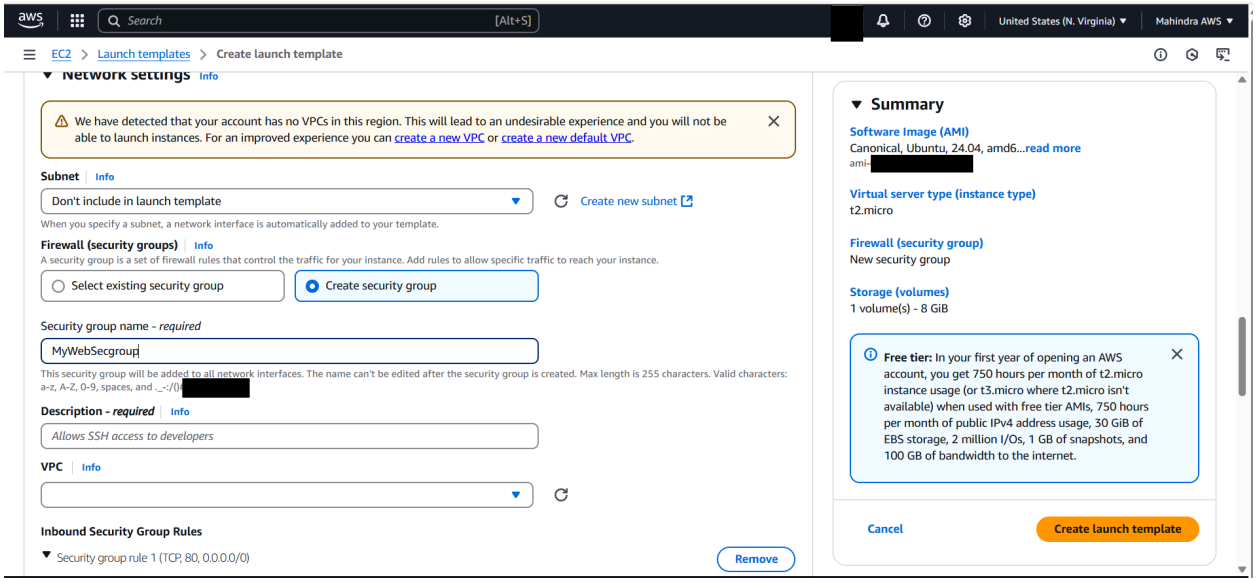

4. Click the Search For AMI link to locate one of the Ubuntu Server LTS AMIs. If you're in the `us-east-1` region, you can use **ami-0ac019f4fcb7cb7e6**.

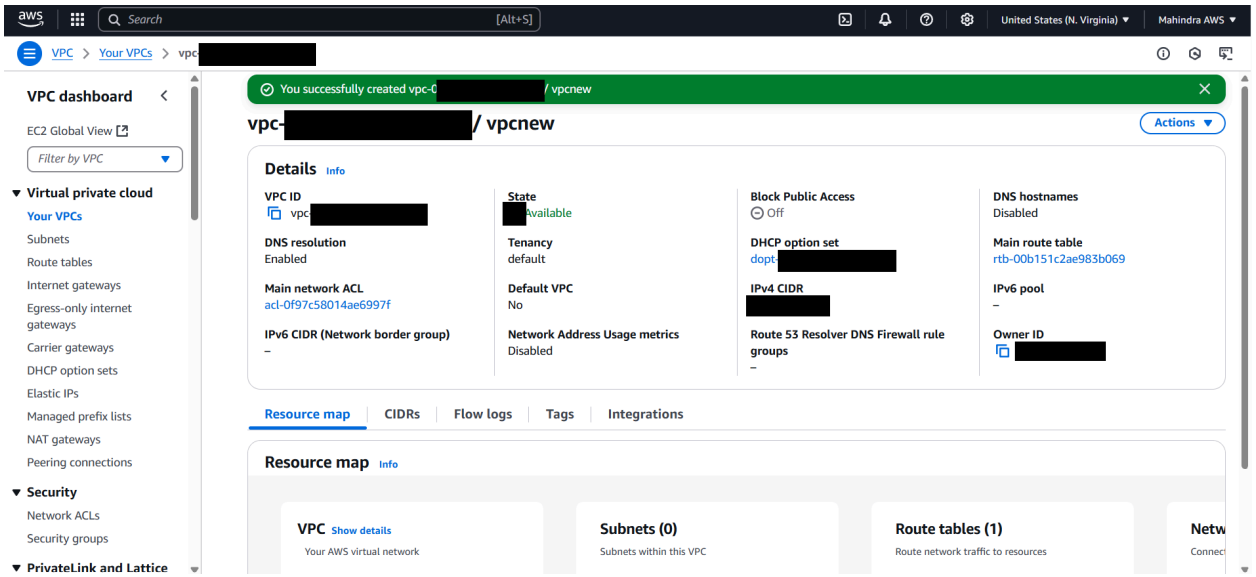

5. For Instance Type, select t2.micro.

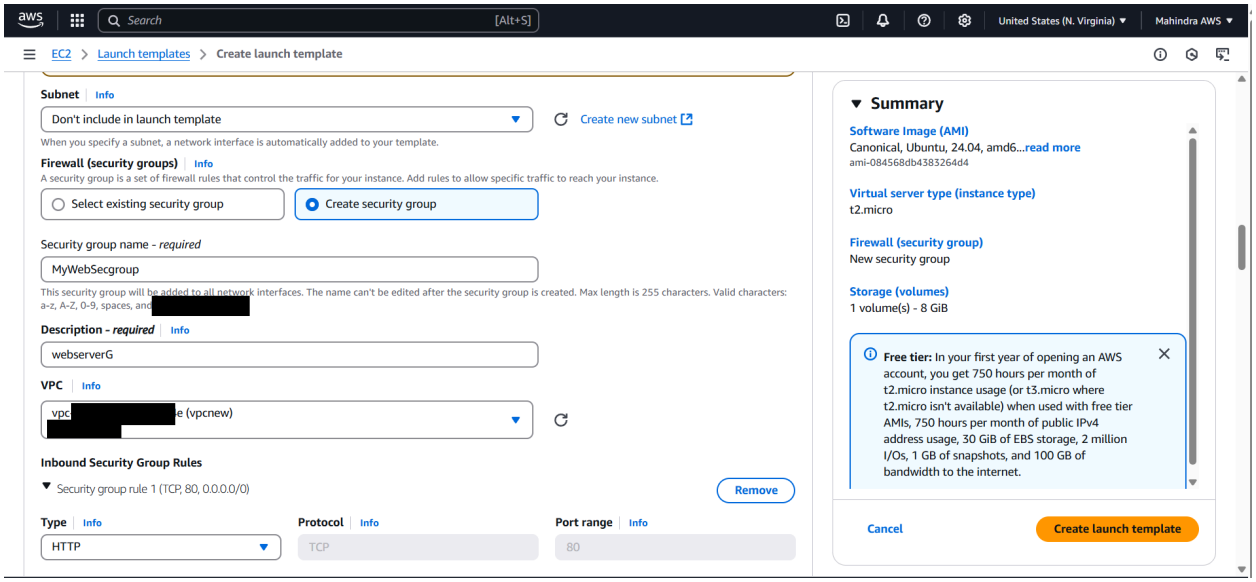

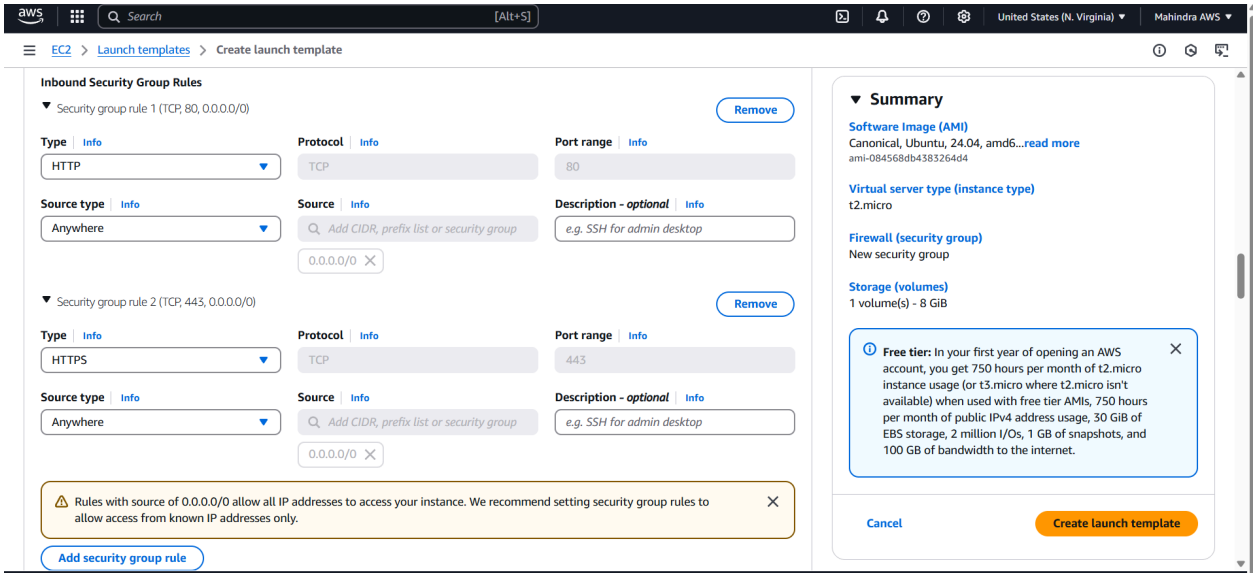

6. Under Security Groups, select a security group that allows inbound HTTP access. Create a new security group if necessary.

Creating a VPC for Security group

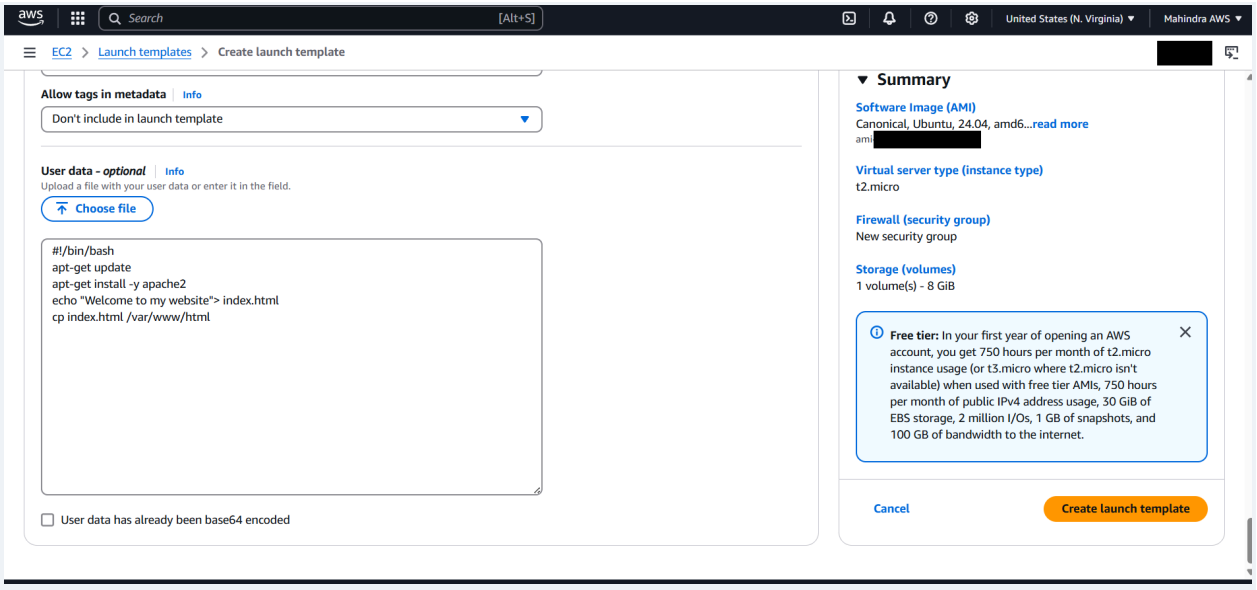

7. Expand the Advanced Details section and enter the following in the User Data text field:

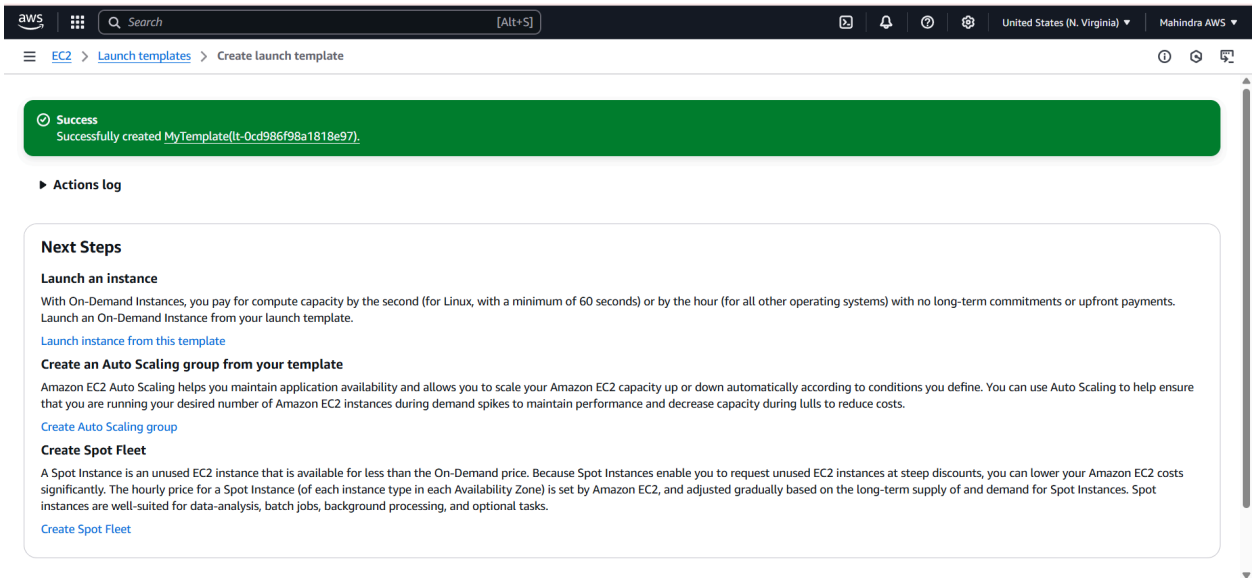

```
#!/bin/bash
    apt-get update
    apt-get install -y apache2
```

```
    echo "Welcome to my website"> index.html

    cp index.html /var/www/html
```

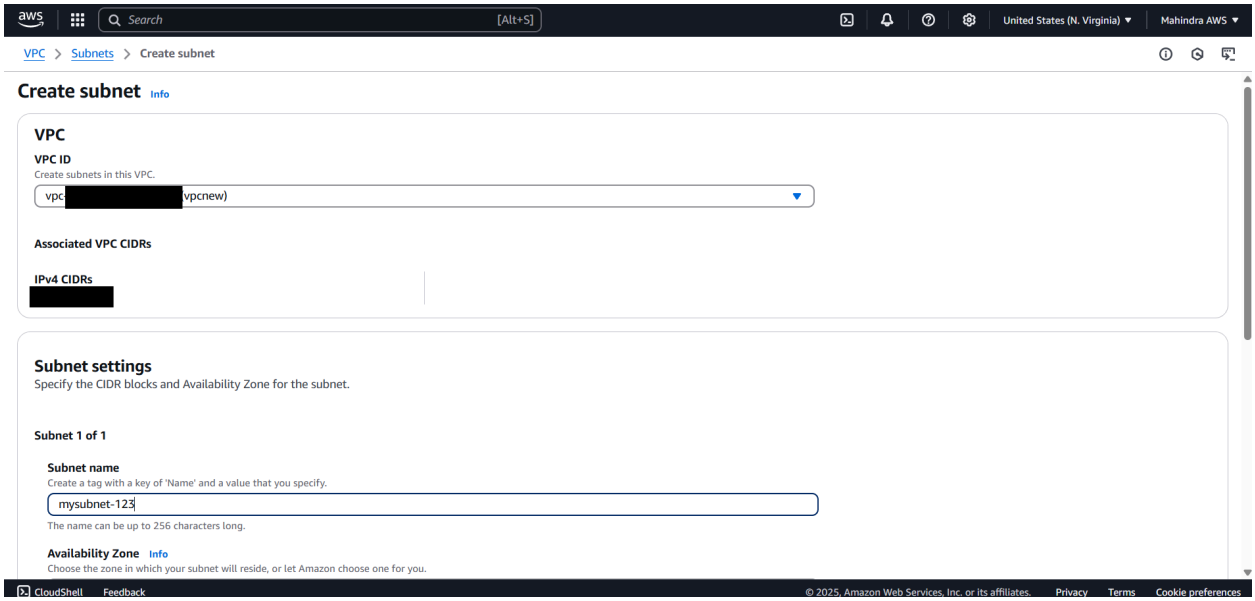

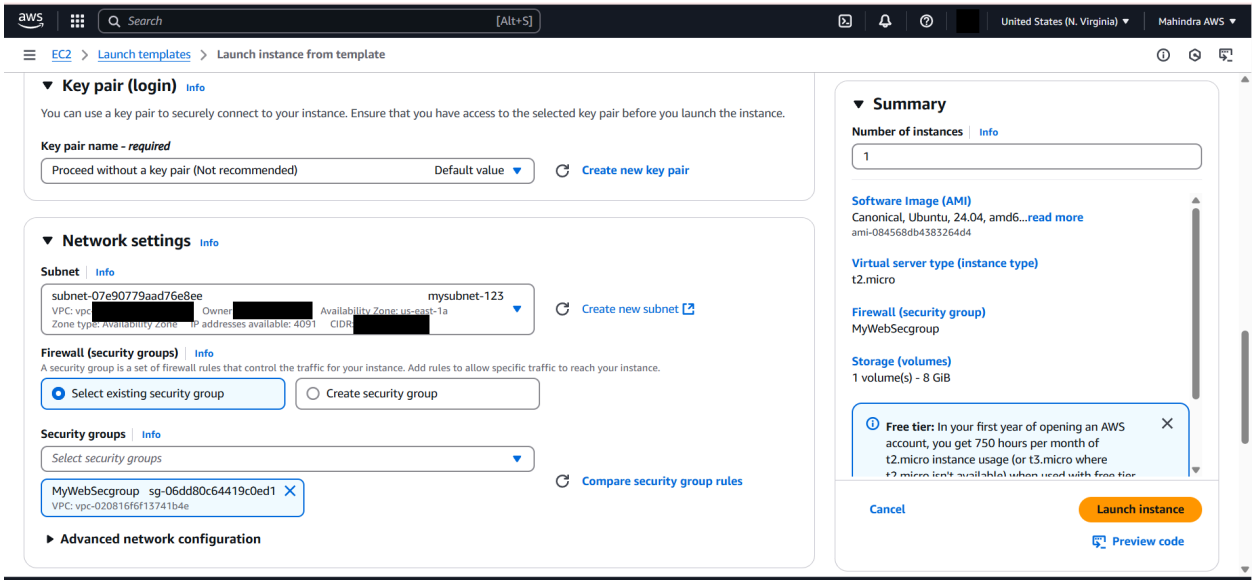

8. Click the Create Launch Template button.

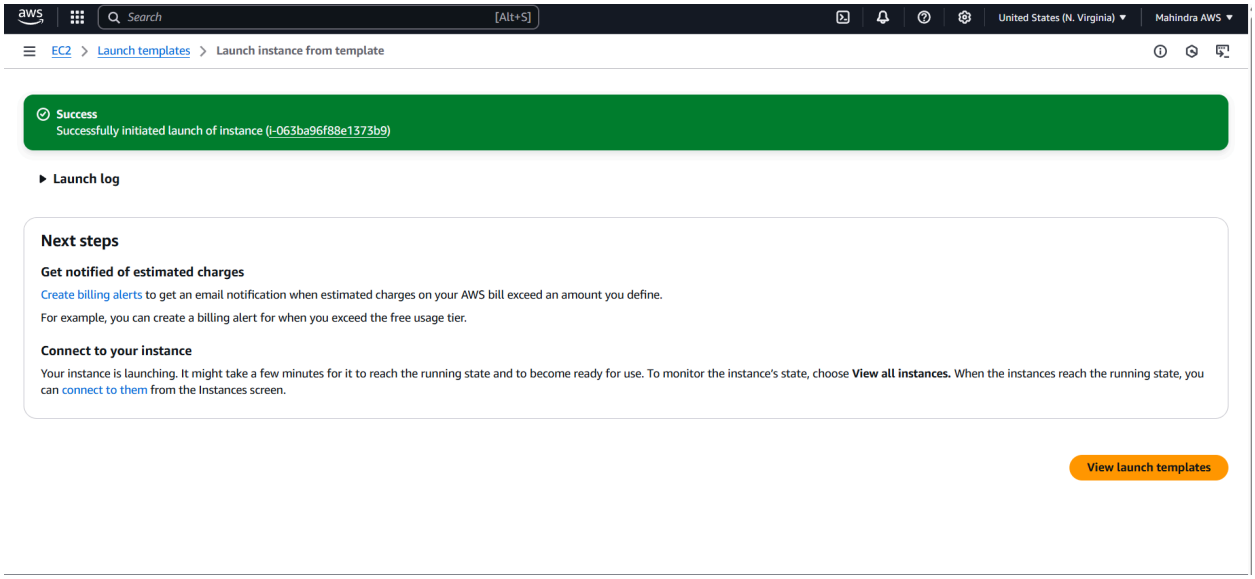

9. Click the Launch Instance From This Template link.

10. Click the Launch Instance From Template button.

11. After the instance boots, browse to its public IP address. You should see a web page that says “Welcome to my website.”

Welcome to my website

12. Terminate the instance when you're done with it.
